Cloud Computing

Security and Privacy

- Companies live by security
- Privacy
  - Authentication
  - Authorization
- Ex: NOVA, OneDrive

Breakdown Of Cloud

- Client Computer and the application (what we use)
- Computers, servers, and data storage systems that make "cloud" (what we don't see)
- Central server administers system to run smoothly
- Middleware
- Virtualization
- Storage
- Redundancy

Cloud Computing Architecture

- Front end, back end, cloud based delivery, and a network.
- Front end (client) interacts with storage
- Storage (public, private, community)
- SaaS
- DaaS
- PaaS
- IaaS

How Cloud Works

- Idea that evolved in the late 1900s
- Local computers don't have to do all the heavy lifting
- Network of computers of the cloud handle running applications
- User computer needs to be able to run the interface software of the cloud computing system
- Ex: Yahoo! Mail, Hotmail, Gmail, etc. vs. Outlook

SaaS

- Software as a Service
- Common delivery model for many business applications
- Potential to reduce IT costs by outsourcing hardware and software maintenance to the SaaS provider

PaaS

- Platform as a Service
- Allows for the developing, running, and managing web applications without the difficulty of building and maintaining the infrastructure associated with developing an application.
- Can be a cloud service where the user controls the software and the provider controls the IT side, or can be installed in the companies infrastructure as a service and managed by companies IT.

IaaS

- Infrastructure as a Service
- Offer computers, physical or virtual machines, and other resources
- Taking the physical hardware and going completely virtual
- Eliminates the need for data center, heating, cooling, and IT maintenance

Conclusion

- Overall, cloud computing is the next big thing. Many free web applications we use already apply cloud computing. It greatly reduces the costs of infrastructure and IT for businesses. Cloud computing has various options as well meaning it is very flexible.
